

Why Successful Change in Multicultural Environments Depends Less on Managing Stakeholders than Understanding Executive Judgement

The Meeting That Changed My Thinking

The boardroom overlooked the skyline of Manama. Around the table sat senior executives, government representatives and functional leaders, each carrying responsibility not only for the performance of the organisation but also for Bahrain's broader economic development agenda. For several months we had been reviewing the organisation's structure, governance arrangements, strategic capabilities and operating model. The analysis was rigorous, the recommendations carefully developed and the evidence compelling. From a technical perspective, the proposed organisational redesign was both logical and achievable.

Yet as the discussion unfolded, I realised we were not debating organisational design.

We were debating the future identity of the institution.

The conversation quickly moved beyond reporting lines, governance structures and operating models. Executives questioned what the organisation should become, how it should fulfil its national mandate and what responsibilities it carried towards government, business, entrepreneurs and Bahraini society. Everyone around the table supported the organisation's future success, yet they frequently reached different conclusions about the most appropriate path forward.

Watching the discussion unfold, I realised that I was not observing resistance to organisational change.

I was observing executive judgement in action.

At the time I did not yet have the language to explain what I was seeing. Like many consultants, I initially assumed these differences reflected competing stakeholder interests or the inevitable politics of organisational life. Experience gradually persuaded me otherwise. These were thoughtful, capable leaders working from the same evidence and pursuing the same organisational objectives. Their disagreement arose not because they wanted different outcomes, but because they evaluated the organisation through different institutional lenses. They held different assumptions about what constituted legitimate organisational action, what responsibilities leadership required and what future best served the institution they were entrusted to lead.

That meeting has remained with me because I encountered the same pattern repeatedly throughout more than twenty-five years of consulting across Africa, Europe and the Gulf Cooperation Council. Whether working with multinational banks navigating digital transformation, family-owned conglomerates balancing commercial and family priorities, universities responding to increasing regulatory oversight or government institutions pursuing national development objectives, I consistently observed remarkably similar conversations. Highly competent executives interpreted the same organisational reality in fundamentally different ways, despite sharing the same information, participating in the same strategic discussions and pursuing the same organisational goals.

These experiences eventually shaped my doctoral research. Drawing upon Strong Structuration Theory, I became less interested in explaining organisational behaviour and more interested in understanding the evaluative processes that precede behaviour. Before executives support or oppose organisational change, they first interpret the situation they face. They judge whether the proposed direction is legitimate, what responsibilities they owe to others and whether they possess sufficient influence to shape the outcome. Behaviour, I came to realise, is not the beginning of organisational transformation. It is its consequence.

This insight ultimately led to the development of the Worldview LOA Framework, which proposes that organisational transformation is shaped not simply by structures, strategies or stakeholder management, but by the way executives evaluate legitimacy, obligation and agency before deciding how to act.

The pages that follow explore this proposition. Drawing upon experiences from government, banking, higher education and multinational consulting, I argue that the central challenge of organisational transformation is not simply managing stakeholders or implementing strategy. It is understanding how executive judgement is formed within environments characterised by institutional complexity.

Institutional Complexity Is Not Stakeholder Complexity

One of the most common misconceptions in organisational transformation is the assumption that complexity increases simply because organisations have many stakeholders. Stakeholder diversity

certainly makes leadership more demanding, but it is not the primary source of institutional complexity. Complexity arises because different stakeholder communities are embedded within different institutional logics that shape how they define appropriate organisational action.

Regulators evaluate decisions through the logic of public accountability and compliance. Academic communities interpret the same decisions through the logic of scholarly integrity and academic freedom. Government ministries consider national policy objectives. Professional bodies seek to preserve disciplinary standards. Executives focus on organisational sustainability, while operational managers remain concerned with execution and service delivery. Each perspective is entirely legitimate because each reflects a different institutional understanding of what the organisation exists to accomplish.

Consequently, organisational transformation is rarely characterised by simple disagreements over organisational priorities. More often, executives disagree because they are drawing upon different institutional worlds to determine what constitutes responsible leadership.

My experience in Bahrain provided an illuminating example. Our review of Tamkeen initially focused on organisational design, governance, capability development and digital transformation. From a technical perspective, the recommendations reflected internationally recognised good practice and were supported by substantial organisational evidence.

Yet implementation was never simply about organisational design.

Each recommendation carried institutional meaning. Strengthening governance communicated expectations regarding public accountability. Digital transformation represented more than technological modernisation; it signalled changing relationships between government, citizens and the private sector. Organisational restructuring raised broader questions concerning national capability, economic development and institutional purpose. The discussion therefore extended far beyond whether the recommendations were technically sound. It centred on whether they represented the right future for the institution within Bahrain's broader economic and social context.

The same dynamics emerged repeatedly in higher education. Universities do not operate within a single institutional system. They exist at the intersection of government regulation, professional accreditation, academic self-governance, public accountability and international scholarship. Each of these institutional domains embodies its own understanding of legitimacy. A curriculum reform may satisfy regulatory requirements while simultaneously challenging disciplinary traditions. A performance management system may improve accountability while provoking legitimate concerns regarding academic autonomy. Stakeholders therefore evaluate the same initiative according to fundamentally different institutional assumptions.

This distinction proved transformative in my own thinking. Earlier in my consulting career I viewed stakeholder management primarily as a process of communication, consultation and engagement. Those capabilities remain essential, but they address only the visible dimension of organisational

change. Beneath every conversation about strategy, governance or organisational design lies a much deeper question.

What makes this course of action legitimate?

Until leaders understand how different institutional communities answer that question, communication alone is unlikely to generate lasting commitment. Organisations do not struggle because stakeholders fail to understand the proposed future. More often, they struggle because stakeholders understand it through different institutional logics.

Once viewed from this perspective, many organisational behaviours traditionally labelled as resistance begin to look very different. Executives are not necessarily defending personal interests or opposing change. More often, they are attempting to remain faithful to the institutional responsibilities that define their professional identities. The challenge for executive leadership, therefore, is not simply to manage competing stakeholders but to cultivate sufficiently shared judgements of legitimacy that diverse institutional communities can commit to a common organisational future.

Beyond Stakeholder Management: Why Traditional Change Management Often Falls Short

For more than four decades, the discipline of change management has provided organisations with valuable frameworks for navigating transformation. Models such as Lewin's three-stage process, Kotter's Eight Steps, Prosci's ADKAR methodology and numerous stakeholder engagement approaches have significantly improved the way organisations plan, communicate and implement change. They have taught leaders the importance of creating urgency, building coalitions, communicating a compelling vision and reinforcing new behaviours. Few large-scale transformations today would be attempted without drawing upon some combination of these well-established principles.

Yet despite the maturity of the discipline, the success rate of organisational transformation remains stubbornly inconsistent. Organisations continue to invest enormous resources in carefully planned change programmes only to discover that implementation progresses far more slowly than anticipated, enthusiasm dissipates over time or behavioural change never fully materialises. Leaders frequently conclude that the problem lies in execution. More communication is introduced. Additional workshops are conducted. Governance structures are strengthened. Change champions are appointed. Progress is monitored with increasing intensity. Sometimes these interventions produce meaningful improvements. Often they do not.

My experience suggests that the difficulty lies not in the quality of these methodologies but in one of their underlying assumptions. Most approaches to change management begin by asking how leaders can help stakeholders accept a predetermined future. The emphasis therefore falls on communication, participation, sponsorship and behavioural reinforcement. While these remain indispensable capabilities, they implicitly assume that once stakeholders understand the rationale

for change, commitment will naturally follow. Understanding, however, is not the same as conviction.

Throughout my consulting work I encountered executives who fully understood the strategic logic behind a transformation while remaining unconvinced that it represented the right future for their organisation. They understood the financial case, appreciated the operational benefits and recognised the external pressures driving change. Yet they continued to hesitate. Their hesitation did not arise from ignorance, fear or incompetence. It arose because they were asking questions that conventional change management seldom addresses. *Is this transformation consistent with the purpose of the institution? Does it honour the responsibilities I carry as a leader? Will it strengthen or weaken the values that define this organisation?* Until these questions were answered satisfactorily, commitment remained cautious and conditional rather than wholehearted.

I encountered this repeatedly in highly regulated environments where transformation affected not only organisational performance but institutional legitimacy. Within higher education, for example, academic leaders seldom evaluate proposed changes solely according to their operational benefits. They also consider their implications for academic freedom, scholarly standards, disciplinary integrity and the long-term reputation of the institution. Similarly, regulators rarely oppose innovation because they dislike change. Their responsibility is to safeguard quality, public confidence and institutional accountability. Government officials must consider broader policy implications, while governing councils focus on stewardship and organisational sustainability. Each stakeholder enters the transformation process carrying legitimate obligations that extend beyond the immediate objectives of the project itself.

Seen from this perspective, many so-called "change-resistant" stakeholders are not resisting change at all. They are fulfilling the institutional responsibilities entrusted to them. Their questions are fundamentally evaluative rather than behavioural. Before deciding whether to support transformation, they seek confidence that the proposed future is not merely efficient but appropriate. They are evaluating legitimacy before they evaluate implementation.

This distinction became increasingly apparent as I reflected upon transformation programmes across banking, government, family businesses and higher education. The technical interventions often looked remarkably similar. Organisations redesigned structures, introduced new governance arrangements, implemented digital technologies, strengthened performance management systems and invested heavily in leadership development. Yet executive engagement varied considerably even when the interventions themselves were almost identical. Some leadership teams embraced change with remarkable conviction, while others implemented the visible elements of transformation without ever fully internalising its purpose. They complied professionally but remained psychologically anchored to the past.

Traditional change management offers limited explanations for this phenomenon because it focuses primarily on observable behaviour. It asks how leaders can influence commitment, reduce resistance and encourage adoption. These are important questions, but they address the visible

outcomes of a much deeper process. Before executives choose whether to support organisational change, they first decide what that change means. They interpret its significance, evaluate its legitimacy and consider its implications for the institution, for others and for themselves. Only then do they determine how they will respond.

Recognising this shifted my own understanding of organisational transformation in profound ways. I gradually came to see that successful change management is not simply a process of influencing behaviour. It is a process of shaping interpretation. The most effective leaders are not merely skilled communicators or capable project sponsors. They are architects of shared meaning. They help diverse stakeholder groups develop a common understanding of why transformation matters, how it aligns with the institution's purpose and what responsibilities each individual carries in bringing that future into existence.

This is particularly important in multicultural environments where organisational change is interpreted through different cultural assumptions, professional traditions and institutional histories. A strategy that appears self-evidently legitimate to one stakeholder group may generate genuine uncertainty for another because each evaluates the organisation through a different set of experiences and responsibilities. Leadership therefore becomes less about persuading people to accept change and more about creating the conditions within which different communities can arrive at a sufficiently shared understanding of the future.

It was this recurring pattern that eventually led me to question whether organisational transformation required a deeper explanatory framework than those offered by traditional change management. If stakeholders were consistently making evaluative judgements before they decided how to behave, perhaps the central challenge of transformation was not behavioural alignment but evaluative alignment. The question was no longer simply how leaders manage change. It became how executives determine what constitutes the right course of action when multiple institutional realities compete for legitimacy.

That question would ultimately become the foundation of my doctoral research and the development of the Worldview LOA Framework. Rather than beginning with behaviour, the framework begins with executive judgement, recognising that transformation succeeds not because people are persuaded to change, but because they first come to see the future through sufficiently shared evaluations of what is legitimate, what responsibilities they owe to others and what influence they possess to shape the outcome. Only then does organisational change move beyond compliance to become genuine institutional transformation.

Understanding Executive Judgement: The Missing Dimension of Organisational Transformation

As I reflected on these experiences across banking, government, higher education and family-owned enterprises, a different question began to emerge. Rather than asking why people resisted change, I found myself asking a more fundamental question: **How do executives decide what constitutes the right course of action in the first place?** It became increasingly apparent that every strategic decision was preceded by a process of evaluation that was largely invisible to conventional

change management. Long before leaders publicly supported or opposed a transformation initiative, they had already formed private judgements about whether the proposed direction was appropriate, responsible and achievable.

This realisation challenged one of the assumptions underpinning much of the organisational change literature. We often observe executive behaviour and infer the reasoning that produced it. We see commitment, hesitation, resistance or advocacy and treat these behaviours as the phenomenon requiring explanation. Yet behaviour is the end of a much longer process. Before executives act, they interpret. Before they interpret, they evaluate. Only after they have reached an internal judgement do they decide whether to support, modify or oppose a proposed course of action. Behaviour, therefore, is not the beginning of organisational transformation. It is its final expression.

Throughout my doctoral research, I repeatedly encountered senior executives facing remarkably similar organisational challenges yet arriving at very different decisions. They worked within the same institution, had access to the same information, participated in the same strategic discussions and were equally committed to the organisation's success. Nevertheless, they interpreted identical circumstances in different ways. One executive viewed digital transformation as an essential investment in the institution's future, while another questioned whether it might inadvertently weaken the very relationships that had underpinned the organisation's success for decades. One regarded organisational restructuring as a necessary step towards greater agility, while another worried about the institutional knowledge that might be lost through restructuring. Neither perspective was irrational. Both reflected sincere attempts to determine what constituted responsible leadership.

What fascinated me was that these differences could not be adequately explained by personality, organisational politics or professional competence. The executives were not making arbitrary decisions, nor were they simply defending personal interests. They were engaging in a process of evaluative judgement that drew upon deeply held beliefs about the organisation, its purpose and their own responsibilities within it. They were asking questions that rarely appeared in project plans or governance frameworks. *What kind of organisation are we trying to become? What responsibilities do we owe to those we serve? What consequences will this decision have for the institution long after this transformation programme has concluded?*

These observations eventually led me to conceptualise executive judgement through three interrelated evaluative questions that seemed to recur across every transformation programme I had studied.

The first concerned **legitimacy**. Executives consistently evaluated whether a proposed course of action represented an appropriate and justifiable direction for the organisation. This judgement extended far beyond technical effectiveness. A strategy might promise improved efficiency, stronger financial performance or enhanced competitiveness, yet still fail to secure executive commitment if it was perceived to conflict with the institution's broader purpose or values. Leaders

were not merely asking whether a proposal would work. They were asking whether it was the right thing for this organisation to do.

The second judgement concerned **obligation**. Executives rarely make decisions as isolated individuals. They occupy positions embedded within networks of relationships that generate responsibilities to multiple stakeholders. Government officials carry obligations to citizens and public policy. Academic leaders remain accountable to students, scholars and the integrity of their disciplines. Corporate executives balance commitments to shareholders, employees, customers and regulators. Family business leaders often carry additional responsibilities to family members, founders and future generations. Every significant organisational decision therefore requires executives to navigate competing obligations that cannot always be reconciled through simple compromise.

The third judgement concerned **agency**. Even when executives believe a transformation is legitimate and feel a strong obligation to support it, they still evaluate whether they possess sufficient influence to make a meaningful difference. Organisational change frequently falters because individuals conclude that their efforts are unlikely to affect the outcome. Conversely, leaders who believe they can shape events often demonstrate remarkable persistence despite considerable obstacles. Agency, therefore, is not simply about formal authority. It reflects an executive's belief that purposeful action can meaningfully influence organisational reality.

Individually, each of these evaluations contributes to executive decision-making. Collectively, they provide a deeper explanation for why transformation unfolds so differently across organisations. Leaders who arrive at similar evaluations of legitimacy, obligation and agency are far more likely to develop shared interpretations of the organisation's future and to act with collective purpose. Where these evaluations diverge, organisations often experience fragmented implementation, cautious compliance or persistent disagreement, even when everyone publicly endorses the same strategic objectives.

This insight ultimately became the foundation of the **Worldview LOA Framework**. Rather than viewing transformation primarily as a process of managing behaviour, the framework proposes that organisational change is first and foremost a process of shaping executive judgement. It recognises that before organisations can align around a new strategy, leaders must first arrive at sufficiently shared evaluations of what is legitimate, what responsibilities they owe to others and how they can exercise meaningful influence within an increasingly complex institutional environment.

The significance of this perspective extends well beyond theory. It changes the questions leaders ask when transformation stalls. Instead of immediately assuming inadequate communication or stakeholder resistance, executives begin exploring how different groups are interpreting the proposed future. They ask why intelligent and committed people have reached different conclusions. They seek to understand the institutional assumptions shaping those conclusions before attempting to change behaviour. In doing so, they shift the conversation from persuasion to understanding and from compliance to shared judgement.

Looking back, I have come to realise that the most successful transformation leaders I encountered were not necessarily the most charismatic communicators or the most accomplished project managers. They possessed something less visible but arguably more important. They understood that organisational change is fundamentally an interpretive process. Their greatest contribution was not simply mobilising people around a strategy but helping them develop a common understanding of why that strategy was both legitimate and worth pursuing. In complex, multicultural and highly regulated environments, that capacity to cultivate shared judgement may be the most important leadership capability of all.

Leading Transformation Through Shared Judgement

If executive judgement lies at the heart of organisational transformation, then the role of leadership changes in a profound way. The executive leader is no longer simply responsible for developing strategy, allocating resources or overseeing implementation. Those responsibilities remain essential, but they are no longer sufficient. Leadership becomes the process of cultivating sufficiently shared judgements so that diverse groups of people, each bringing different institutional obligations and cultural perspectives, can commit to a common future without abandoning the responsibilities that define their professional identities.

This represents a subtle but important shift in emphasis. Much of the change management literature describes leadership as the ability to create urgency, communicate vision and overcome resistance. These are valuable capabilities, yet they implicitly position leaders as persuading others to embrace a predetermined future. My experience has been rather different. The most effective transformation leaders rarely spend their energy convincing people that change is necessary. Instead, they create environments where people can collectively discover why change has become both necessary and legitimate. The distinction may appear semantic, but it fundamentally changes the nature of executive leadership.

Throughout my consulting career I observed that successful leaders invested considerable time in conversations that many organisations regarded as peripheral to implementation. They encouraged debate rather than suppressing it. They explored competing interpretations rather than rushing prematurely towards consensus. They recognised that disagreement often reflected institutional responsibility rather than organisational dysfunction. Rather than asking, *How do we overcome resistance?*, they asked, *What is this resistance telling us about the way different parts of the organisation understand our future?*

These conversations were rarely comfortable. In multicultural environments they often surfaced deeply embedded assumptions about authority, accountability, professional identity and organisational purpose. Executives from different cultural backgrounds sometimes attached different meanings to concepts such as leadership, collaboration, innovation and accountability. Similarly, professionals representing different disciplines frequently approached organisational problems through entirely different intellectual traditions. Financial specialists interpreted success differently from academics. Regulators approached risk differently from entrepreneurs. Public

sector executives balanced considerations that would seldom arise in commercial organisations. Yet these differences were not obstacles to be eliminated. They represented valuable sources of institutional intelligence that, if understood correctly, could strengthen both the quality and legitimacy of strategic decision-making.

One of the most significant lessons I learned was that transformation succeeds not because organisations eliminate difference, but because they develop the capacity to integrate difference into a coherent institutional narrative. The objective is not to create identical perspectives. That would be both unrealistic and undesirable. Complex organisations benefit from diversity of thought, professional expertise and cultural experience. The challenge is ensuring that these differences converge around a sufficiently shared understanding of the institution's future direction. Shared judgement does not require complete agreement. It requires enough common ground for collective action to become possible.

This has important implications for executive practice. Leaders often devote considerable attention to designing organisational structures, refining governance arrangements and introducing new performance management systems. These interventions are undoubtedly important because they establish the institutional architecture within which organisations operate. However, structures cannot create commitment. Governance cannot manufacture legitimacy. Performance systems cannot substitute for conviction. At best, they reinforce interpretations that have already taken shape within the organisation. At worst, they expose the absence of genuine alignment by requiring people to implement changes they have not yet come to believe in.

Consequently, one of the executive leader's most important responsibilities is to make the process of judgement visible. Rather than assuming stakeholders interpret organisational reality in similar ways, leaders should actively explore the evaluative questions shaping executive thinking. What assumptions underpin different interpretations of the organisation's purpose? Which institutional responsibilities are stakeholders attempting to honour? Why do different groups assign legitimacy to different strategic priorities? These conversations require patience and intellectual humility because they acknowledge that organisational disagreement often reflects genuine differences in judgement rather than deficiencies in commitment or competence.

In my own work, I have found that organisations make their greatest progress when leaders stop treating transformation as primarily an operational challenge and begin recognising it as an interpretive one. Once executives understand how legitimacy, obligation and agency shape decision-making, many previously puzzling organisational behaviours become understandable. What had been labelled resistance often reveals itself as concern for institutional integrity. What appears to be hesitation frequently reflects unresolved questions of legitimacy. What is interpreted as disengagement may, in reality, be a diminished sense of agency arising from years of organisational experience. Understanding these underlying judgements allows leaders to address the causes of fragmentation rather than merely responding to its symptoms.

This perspective also changes how we think about leadership capability. In an increasingly interconnected world, executives are expected to operate across national cultures, regulatory environments, professional communities and institutional boundaries. Technical expertise remains essential, but it is no longer the defining characteristic of exceptional leadership. Increasingly, successful leaders are distinguished by their ability to navigate competing worlds of meaning, reconcile diverse institutional expectations and cultivate shared judgement without suppressing legitimate difference. They recognise that organisational transformation is not achieved by aligning structures alone, but by aligning the interpretations through which those structures acquire meaning.

Ultimately, this is why organisational transformation remains one of leadership's greatest challenges. Organisations do not change simply because strategies are well designed or governance arrangements are strengthened. They change because people gradually develop a shared conviction that the proposed future is both legitimate and achievable. That conviction cannot be imposed through authority, nor can it be manufactured through communication alone. It emerges through a process of collective judgement in which executives, professionals, regulators and other stakeholders come to see the future through sufficiently shared interpretations of what the organisation exists to become.

It is in this process of shared judgement that transformation truly begins. Structures, systems and strategies may shape the journey, but it is executive judgement that determines whether organisations merely implement change or genuinely transform.

Conclusion: Transformation Begins with the Way We See the World

Looking back over three decades of consulting, executive education and research, I have come to believe that organisational transformation is fundamentally different from the way it is commonly portrayed. We often describe transformation as a process of implementing strategy, redesigning organisations or introducing new technologies. These activities are undoubtedly important, but they are not where transformation begins. They are the visible expressions of a much deeper process that unfolds within the minds of those responsible for leading change.

Long before organisations adopt new structures, executives have already begun interpreting the future. They are evaluating whether a proposed direction is consistent with the institution's purpose, considering the responsibilities they carry towards multiple stakeholder communities and deciding whether they possess sufficient influence to shape meaningful outcomes. These judgements are rarely visible in project plans, governance frameworks or progress reports, yet they determine whether transformation becomes an exercise in organisational compliance or a genuine process of institutional renewal.

This has become increasingly significant as organisations operate within ever more complex environments. Few executives today lead organisations that exist within a single institutional context. Government policy, regulatory oversight, international markets, technological disruption, cultural diversity, professional standards and public expectations all converge to shape

organisational decision-making. The challenge is no longer simply one of managing complexity. It is one of making sound judgements within complexity. Leadership therefore becomes less about possessing the right answers and more about helping organisations ask the right questions.

The experiences that informed this article—from organisational transformation in Bahrain to executive development across the Gulf Cooperation Council, from banking and family businesses to higher education—have consistently reinforced the same lesson. Organisations rarely fail because their strategies are technically flawed. More often, they struggle because leaders assume that others interpret organisational reality in the same way they do. They underestimate the extent to which different institutional experiences produce different understandings of legitimacy, responsibility and appropriate action. As a result, they invest heavily in changing systems while giving insufficient attention to the judgements through which those systems acquire meaning.

For executive leaders, this presents both a challenge and an opportunity. The challenge is recognising that transformation cannot be reduced to a sequence of implementation activities. It is a continuous process of building shared understanding across communities that inevitably see the world differently. The opportunity lies in appreciating that these differences need not be barriers to change. When approached thoughtfully, they become sources of richer insight, stronger decisions and more resilient organisations. The objective is not to eliminate diversity of perspective, but to cultivate sufficient alignment that diverse perspectives can contribute to a common institutional purpose.

This is the central proposition of the Worldview LOA Framework. It suggests that sustainable organisational transformation depends upon the quality of executive judgement before it depends upon the quality of organisational execution. By understanding how leaders evaluate legitimacy, obligation and agency, organisations gain deeper insight into why executives confronted with the same circumstances often reach different conclusions and why seemingly well-designed transformation programmes produce markedly different outcomes. The framework does not replace established approaches to change management. Rather, it complements them by illuminating the evaluative processes that precede observable behaviour and ultimately shape organisational action.

Perhaps this is the most important lesson I have learned throughout my own journey. Transformation does not begin when organisations announce a new strategy or launch a change programme. Nor does it begin with a revised organisational structure, a digital platform or an updated governance framework. Those are important milestones, but they are not the point of origin.

Transformation begins when leaders start to see their organisation differently.

It begins when executives develop a shared understanding of what is legitimate, what responsibilities they owe to the institutions they serve and how their own actions can contribute to a future that is both meaningful and sustainable. Only then do strategies become more than plans,

governance become more than oversight and organisational change become more than implementation.

Only then does transformation become possible.
